Stabilization of ammonium oxide in aqueous solutions of electrolytes.  
E. Jozefowicz, E. Witekowska, and W. Zajączkowski (Roczn. Chem." 1960, 34, 64-70).—The solubility of  $\text{Ag}_2\text{O}$  is investigated in aqu. solutions of halides, nitrates, and sulphates of  $\text{NH}_4$  and of alkali and alkaline-earth metals. The plot of  $\log$  solubility of  $\text{Ag}_2\text{O}$  against concn. of added electrolyte is not linear as it should be if the theory of Debye and McAlley were valid in this case. The experimental data may be expressed by an empirical formula  $\log S = \log S_0 + \alpha - b^2$ , where  $S$  is the solubility of  $\text{Ag}_2\text{O}$  in pure solvent,  $S_0$  the concn. of electrolyte,  $S_0$  the solubility of  $\text{Ag}_2\text{O}$  in pure solvent,  $\alpha$  and  $b$  are empirical constants. Values of  $\alpha$  and  $b$  for different salts are given. In the case of nitrates and sulphates the empirical formula  $\log S = \log S_0 + \alpha - b^2$ , where  $n < 2$ , may be applied only up to the concn.  $2-2.5n$ . The simplifying assumptions of Debye and McAlley are no longer valid for more complicated ions. The deforming effect of the electrolyte ions on the net. of the non-ionic solute and the solvent is more pronounced in this case because of their dipolar structure.  
S. M. RYBICKA

Title : Spectrophotometric Investigation of Compounds of Molybdenic Acid with Complex Cyanides.

Orig Pub : Chemia, 1957, 6, No 18, 23-36

Abstract : An investigation was made of the ultraviolet spectra of absorption of complexes of molybdenic acid  $K_4[Fe(CN)_6]_7$ ,  $K_4[Fe(CN)_5FO_2]_7$ ,  $K_3[Fe(CN)_5NH_3]_7$ ,  $K_3[Fe(CN)_5H_2O]_7$ , and also the dependence of the optical density on the concentration of the complex and on the pH of the medium. It is shown that as the dipole moment of the investigated complex increases, the molar absorption coefficient also increases.

Orig Pub: Rocz. chem., 1957, 31, No 2, 395 -412.

Abstract: The reaction kinetics of iodine, in a solution with gaseous SO<sub>2</sub> on the phase boundary was investigated. The first reaction determined by the equation SO<sub>2</sub> + I<sub>2</sub> + 2H<sub>2</sub>O = H<sub>2</sub>SO<sub>4</sub> + 2HI (1), were examined. The effect of various factors on the reaction (1) was studied. It was determined that the order of the investigated

Abstract: reaction  $\sim 0.5$ , proceeds to its end faster than the lower initial concentration of  $I_2$ . The variation of the reaction rate constant with the temperature is insignificant. The increase of the liquid phase mixing rate accelerates the process. The lower the viscosity of the solvent, the higher the rate of reaction. Solutions of  $I_2$  in ethyl, methyl and isopropyl alcohols with various aqua contents, as well as in pure water were investigated. The rate of reaction drops with the decrease of the boundary surface. The addition of light metal salts accelerates the investigated conversion. Studies were carried out in 0.5 MKI,

17

POLAND / Physical Chemistry. Kinetics. Combustion. Explosions. Typochemistry. Catalysis. B

Abs Jour: Ref Zhur-Khimiya, No 17, 1958, 56759.

Abstract: KBr, KCl and NaCl. The addition of HI accelerates, and the addition of H<sub>2</sub>SO<sub>4</sub> decelerates the investigated conversion within the limits of determined concentrations. The rate of reaction increases proportionally to the first stage pressure of the gaseous SO<sub>2</sub>. It is assumed that the iodine takes part in the reaction in its atomic form, forming a "critical complex" SO<sub>2</sub>I. The probable reaction mechanism: I<sub>2</sub> → 2I; I + SO<sub>2</sub> ⇌ SO<sub>2</sub>I; SO<sub>2</sub>I + I ⇌ SO<sub>2</sub>I<sub>2</sub>; SOI<sub>2</sub> + 2H<sub>2</sub>O ⇌ 2HI + H<sub>2</sub>SO<sub>4</sub>.

TITLE: Spectrophotometric investigation of compounds of molybdenum acid with cyanide complexes. Part IV

PERIODICAL: Referativnyy zhurnal, Fizika, no. 2, 1963, 31, abstract 2D183 ("Roczn. chem.", 1962, v. 36, no. 3. 377 - 388, Polish; summaries in Russian and English)

TEXT: The absorption spectra of solutions of complex compounds of molybdenum acid with complex cyanides of iron, molybdenum and tungsten were investigated in the region 250 - 550 m $\mu$  at pH 1 - 7. Spectral curves are given. It has been found that the spectra of the indicated compounds (except those containing tungsten) are similar and have two absorption maxima at 310 - 330 and 360 - 400 m $\mu$ . The structure of the formed complexes is discussed. There are 26 references. For part III see RZh Fiz, 1960, no. 9, 24900.

The author writes about the problems and difficulties encountered by an architect-conservator in his work. Quite apart from normal problems of town-planning use, function, techniques and art, he must undertake thorough and accurate surveys with special instruments. His study of the monument itself must be followed by research into material in the archives. He must also overcome difficulties which arise in organising the work through the fact that to each relic must be applied an individual preservation treatment, so that it may stand for centuries as a monument of national culture.

TITLE: Biological effect and prophylaxis of microwave irradia-tion

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 7, 1962, abstract 7-5-24 f (Prace Przemysł. inst. telekomun., v. 11, no. 34, 1961, 47 - 55) ✓

TEXT: The electromagnetic energy of a microwave beam possessing considerable power density can produce changes in living organisms subjected to the action of this energy. The changes caused by microwave irradiation are in most cases reversible. The establishment of an exact correlation between irradiation dose and reaction of the organism is still at an experimental stage. The prophylaxis suggested is: to observe precautionary measures in operating micro-wave sources, to eliminate secondary sources radiating power scattered unintentionally, to shorten the working day, and to use absorbing screens or protective clothing. Catalytic decoloration of colored natural juices. A. Krause and A. Witkowska (Univ. Poznan, Poland). Bull. soc. chim. (1), 1951, 311, 100-15 (1951) (in English).

The decoloration of red beet juice at 37° by  $\text{H}_2\text{O}_2$  in the presence of  $\text{Fe(OH)}_3$ , I and Cu compds. as catalysts was studied spectrophotometrically with  $\lambda = 520$  m $\mu$ . The rate of the reaction with I corresponded to a 1st-order reaction. The peroxidative properties of I were greatly activated by  $\text{CuO}$  when mixts. of air-dried I and  $\text{CuO}$  were used. The activation was still greater when the combined catalysts were pptd. together as hydrides and air-dried, as little as  $10^{-10}$  g. Cu as  $\text{Cu(OH)}_2$  showing activity compared to about  $10^{-4}$  g. Cu as  $\text{CuO}$ . Moist gel catalysts were even more strongly active, since they had more surface.

In this case,  $10^{-10}$  g. Cu as  $\text{Cu(OH)}_2$  contained in I (corresponding to  $8 \times 10^{-4}$  g. Fe) accelerated the decoloration of the juice at 37°. The combined catalyst of a compd. corresponding to an at. ratio  $\text{Fe:Cu} 1:10^{-3}$  caused the decoloration in 9 hrs., whereas I alone needed 9 hrs. 20 min. The mechanism of the reaction was discussed. R. G. Rice

"Hypotensive Duodenography in the Diagnosis of Subacute  
Pancreatitis"

Warszaw, Polski Tygodnik Lekarski, Vol XVIII, No 6, 4 Feb  
1963, pp 207-210

Abstract: Authors' English summary modified. Hypotensive  
duodenography was introduced into the diagnosis of pancrea-  
tic diseases by the Lyon school 3 years ago. The techniques  
used by the authors are described. Hypotonia of the duode-  
num was obtained by antrotonyl injection and introduction of  
20 cc 2% solution of xylocaine into the duodenum. 54 hypo-  
tensive duodenographies were performed, 23 of them in di-  
seases of the pancreas.

TITLE: A spectrographic method of determining indium in  
lead and slags

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 10, 1962, 139,  
abstract 10D68 (Rudy i metale niezel., v. 6, no. 7,  
1961, 311-313)

TEXT: Lead electrodes are used as standards for the determination of  
indium in lead. They are made by adding specific amounts of indium  
(0.001-0.15%) to metallic lead of high purity and fusing. The standards  
and samples, measuring 10 mm in diameter, are excited in a spark  
(12,000 v) for 24 sec. The spectra are recorded by means of a medium-  
dispersion spectrograph on spectrum plates. The analytical line pair  
In 3256.090 - Pb 3240.192 Å is used. To analyze indium in slags a  
specimen (1 g) is dissolved in 10 ml  $\text{HNO}_3$  (1:1), 3 ml 0.1% solution  
 $\text{Ga}(\text{NO}_3)_3$  (used as an internal standard) is added, and the mixture is

B168/B180

evaporated to dryness at 100°C. The dry residue is ground and placed in the crater of a carbon electrode (diameter 2.5 mm, depth 3 mm). The upper electrode is a pointed carbon rod and the gap between it and the lower electrode is 3 mm. The sample is subjected to an a.c. arc (4.5 amps) for .5 sec. The spectra are recorded on special plates by means of a Q-24 spectrograph with a slit width of 0.010 mm. The lines In 356.0 Å - Ca 2943.6 Å are used as reference pairs. The mean error is 4.2% for metallic lead, and 7.5% for slags. Time required for the analysis - 1.5-2 hrs. [Abstracter's note: Complete translation.]

AUTHOR: Witkowski, Andrzej

TITLE: The nature of electron-nuclear coupling in dimers

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1962, 14-15, abstract  
24B68 (Roczn. chem., v. 35, no. 5, 1961, 1399 - 1408 [Eng.;  
summaries in Pol. and Russ.]).

TEXT: A Hamiltonian is derived which describes the motion of the electrons and nuclei during resonance interaction of two identical molecules, one of which is in an excited electron state. This Hamiltonian contains terms rendering a strong electron-vibration interaction. This is because the pure electron resonance interaction is disturbed when the nuclei undergo different displacements from the equilibrium position of the two molecules. The corresponding eigenfunctions cannot be approximately calculated in adiabatic approximation, so that the exact eigenvalues correspond to simultaneous electron and vibrational states. Conditions for separating the motions of the electrons and nuclei in special cases are discussed, as is the structure of the electron energy surfaces. A system of two ethylene mole-

TITLE:

Strong and weak coupling solutions of electron-vibration equation for dimers

PERIODICAL:

Referativnyy zhurnal. Khimiya, no. 21, 1962, 6-7,  
abstract 21B13 (Roczn. chem., v. 35, no. 5, 1961,  
1409-1418 [Eng.; summaries in Pol. and Russ.])

TEXT: The author examines approximation methods of solving the electron-vibration equation that describes the vibrational functions of the non-adiabatic wave function of the electron excited state of a dimer under the resonance interaction of monomer segments. The hamiltonian of the electron-vibration system has the form  $\frac{1}{2}(p^2 + q^2) + bq\sigma_3 + C\sigma_1$ , where  $q$  is the vibration coordinate of the relative movement of the monomer units,  $p$  the corresponding momentum,  $\sigma_1$  and  $\sigma_3$  the Pauli matrices, and  $C$  the constant of resonance interaction. If the resonance interaction is strong the term  $bq\sigma_3$  can be regarded as a perturbation in relation to the zeroth

Card 1/2

Strong and weak coupling solutions ...

S/081/62/000/021/002/069  
B168/B101

approximation corresponding to the harmonic vibration of the dimer in different electron states common to both monomer units. On the other hand, if interaction is weak, the electron excitation of a monomer can be transmitted to another monomer only through vibrations which disturb the conditions of resonance by fulfilling the condition  $bq \gg C$ . The approximate non-adiabatic wave functions were determined in these two extreme cases and the intensity distribution in the electron spectrum of the dimer was calculated. A molecule of 2,2,1-dicycloheptadiene was taken as a concrete example. [Abstracter's note: Complete translation.]

TOPIC TAGS: molecular crystal, coupling, exciton coupling, molecular phonon,  
Hamiltonian, boson, exciton separation, exciton, phonon

ABSTRACT: The coupling of excitons with molecular phonons results from a change of molecular potential energy in the excited molecular electronic state. The exciton-phonon Hamiltonian, when written in the second quantization language, contains terms which are linear in the phonon variables. Separation of excitons (treated as bosons) from the phonon variables by a suitable unitary transformation leads to an exciton-exciton interaction term. Some possible

Mickiewicza, Poznan, Poland). Chem. Anal. 3, 1049-52 (1958) [English summary].—A simple method for detg. CaO + MgO and Na<sub>2</sub>O + K<sub>2</sub>O in tech. glass by means of paper glass in a Pt crucible or a small evapg. dish; add a few drops of distd. water and a few ml. 40% HF. Heat under cover for 10 min. Mix and evap. to dryness, wet the residue with 2-4 drops 2N HCl, and heat for 1-2 min. Remove fluorides by the method described by Alimarin (C.A. 44, 3404d). Treat the residue with a few ml. 2N AcOH and evap. almost to dryness, dil. with water, and mix and allow the soln. to stand to coagulate Fe(OH)<sub>3</sub> and Al(OH)<sub>3</sub>. Take 0.1-1 ml. of sample for each detn. Use glass plates with 8 wells; fill 4 of these with 0.5 ml. of the substance examd. and the remaining ones with standard solns. in amts. of 0.4, 0.6, 0.8, and 1 ml., resp. Cover the wells with 8 strips of cationite L-W 28 paper. When the solns. are completely absorbed, wash the strips with 0.1 ml. distd. water and sprinkle with satd. soln. contg. quinalizarin. The zone config. K-group elements will be light-violet, whereas that of the Ca-group elements will be deeply blue-violet. By comparing the surfaces of the zones with standards, the percentage of Na<sub>2</sub>O + K<sub>2</sub>O and CaO + MgO can be detd. Trivalent metals can be removed by pptn. with CO<sub>2</sub>-free NH<sub>3</sub>. Z. Kurtyka
